Benefits of Beck Bioelectrifier

Dear Editor: I'd like to tell you of my experience with a Beck "zapper". For the first time in 20 years I had become ill enough to spend over a week in bed and 10 days off work. Yes, I was unfortunate enough to get the flu.

The problem was that although the main flu symptoms had gone, I was left with some very disabling symptoms. Firstly, I woke every morning with a headache and absolutely no energy, which persisted all day long. The second problem was that my Eustachian tubes were completely obstructed, and in a profession that relies on listening I found it very difficult to work.

Working at Complementary Health Centres, I had a total of five therapists trying to solve my problem, plus all the nutrients and supplements you could imagine. However, nothing was helping.

By the fourth week I was desperate and a friend of mine brought back a machine, called a "Beck Bioelectrifier", that I had helped him build a few months earlier. This small box basically puts out a very special electric pulse which will kill viruses, bacteria and parasites in the blood. It was built because it was supposed to convert HIV-positive people to HIV-negative in 21 days. This I was more than sceptical about. However, in my desperation I was now willing to try anything.

I stuck the silver electrodes to the pulse points on my ankles, switched on the Bioelectrifier and turned up the power until I could feel a slight tingling. The treatment lasted for one hour. I then drank plenty of water and went to bed. The next morning I woke before the alarm, with no headache and with energy. For the first time in four weeks I had energy! My ears still remained blocked but were making encouraging clicking sounds! I used the Bioelectrifier again that evening. The next morning my ears were clearing. I couldn't believe it. I had tried everything and nothing had worked, and yet in just two days my energy was back and my ears were clear.

I was so impressed by this device that I have built my own and am planning to do some clinical trials on HIV patients in con-

junction with medical verification of HIV status. I shall let you know of the results.

Christopher Hyslop, registered homoeopath, Complementary Health Centres, Hove, East Sussex, UK, ph 01273 722421.

EM Weapons Used at OKC?

Dear Editor: Just sitting here thinking about some of the info in your last issue, particularly the EM weapons usage at the Oklahoma City Murrah Building. [See "Bright Skies", Part 5, NEXUS 5/01.] That clarifies so much. You see, my five-year-old daughter lived in Oklahoma City at the time.

The Murrah Building was where her day-care centre was; my ex-wife was stationed there. A few minutes before the "bomb" exploded, she said she started to feel strange vibes and took my daughter Hailey and left the building.

She mentioned the pre-explosion tremor that you mention in your article.

I have also spoken with several others who verify her story, but, until your article, the idea of a Tesla-type weapon never crossed my mind. After reading it and discussing the implications with some friends, they agree that it could be possible.

Do you know of any other places where I might be able to find out more about this theory? As you can guess, since it directly affects my family, I am a bit more concerned than the average reader.

Thanks again for the great articles. The Clem Over-Unity Engine [NEXUS 5/01] is a passion of our research editor! If he finds anything new, we'll let you know.

Rob, *Reality Magazine*, RealityMAG@aol.com

Fireball in Arizona

Dear Ed: Just want to say that the article about fireballs was great. [See "Bright Skies" series, NEXUS 4/03 to 5/01.]

As a child, some time ago, I saw one over the Arizona desert. It was the most beautiful thing ever. It shot down out of the sky, spiralled, and went right back up into the night sky. I can remem-

ber the long white tail.

The only other person who saw it was my sister. To this day we still talk about it. Not sure what it was, but if it was weapons testing, then I sure hope I'm not around if they ever use it.

Keep up the good work!

Joby P., prazak@phnxpop1.phnx.uswest.net

NEXUS Newlyweds!

Dear Duncan: This is a very special thank-you to you and all at NEXUS. Thanks to you, I met my soul mate, Michael Relfe, and we are now very happily married—a year and a half after the Sydney NEXUS Conference where we first met!!!

It was a miracle that we met. I lived in Sydney and Michael lived in Florida, USA. I believe your Conference was used as one of God's tools for us to meet.

I have read NEXUS for years. May your magazine circulation grow quickly, because it contains really useful information that everybody should know about.

Stephanie Relfe (née Wilkins), kinesiologist, www.geocities.com/HotSprings/3578

Drug Company Victimisation

Dear Duncan: We have just read your editorial in the Dec-Jan issue [5/01] and the article by Sam Chachoua on "Induced Remission Therapy". Like you, we are awaiting "the apocalypse" and the uncovering that needs to be done so that people are able to make their own choices rather than have rubbish pushed down their throats by money-driven pharmaceutical companies. Are we mad? You bet.

You made reference in your editorial to some of your regular advertisers being driven out of NEXUS by the "international therapeutic drugs network". We are one of those. Our 'crime' was to provide people with a choice to help themselves with a cheap, effective, oxygen therapy. Because a lot of 'natural' products like hydrogen peroxide, herbs and minerals are unpatentable and are cheap to procure, agencies in this world network do their utmost to brand us as criminals. Little wonder when their motive is money; it is reported to cost in excess of

US\$100 million to bring a new drug on the market. Are they going to let something that you can grow in your back garden jeopardise that?

As you state in your editorial, there is an underground war being waged by people who want to take responsibility for their own well-being. We have had many people coming to us wanting to get off HRT, anti-depressants and many other nasties, and many people's lives have been changed for the better. Don't get us wrong: a doctor or surgeon would be the first person we screamed for if we were hit by a car—but when it comes to synthesised drugs, no thanks!

And now for the positive: people like us (and there are millions, and growing daily) are eating this elephant, one bit at a time. "They" win the occasional battle but the people will win the war. More and more of us are turning our backs on the 80-year-old medical propaganda machine and are embracing the tried-and-true therapies of the past. It is just a pity that at this moment in time we are unable to advertise this fact in NEXUS.

Keep up the brilliant work.

Rob Kerridge and Donna Wakelin, Life Force Distributors, Edenbridge, Kent, UK, ph 01732 867550.

Animal Mutilation Puzzle

Dear Duncan: I was reading through an old NEXUS Magazine [4/02] and read the article on animal mutilations. I decided to pass on an occurrence which we had and which we cannot explain.

We had a mob of Santa Gertrudis steers being topped off for market, grazing on a grass/lucerne pasture; no trees, no stumps, etc. The animals were contained by a portable electric fence in the pasture which we were strip-feeding, not far from the house.

One morning we noticed one of the steers was down and we went to investigate. Our first concern was bloat. He was on his side, stiff as a board, legs outstretched as though in a standing position, except on his side with his legs parallel to the ground. The skin all over the body was tight but he was not bloated. This state is

NB: Please keep letters to approx. 100-150 words in length. Ed.

more usual in a beast which has been dead for a few days and gases up internally. This fellow was alive the day before. Usually a beast which dies from bloat, apart from being blown predominantly on the near or left-hand side, regurgitates foamy matter by mouth and usually makes some attempt to get up if on the ground or shows some sign of movement.

This one had no signs of struggle; fresh, unchewed lucerne was in his mouth as though he had died suddenly. This beast was the healthiest, best-looking animal in the herd and always improved much faster than the rest.

The unusual thing was he had an incision between his legs about one-third of the way from his scrotum to the rectum, about 75-100 mm long, dead centre. It appeared to be a puncture wound which had widened extensively on the edges around the entry. It was fresh but there was no blood.

I had some neighbours have a look at it. They could not offer any explanation despite being cattle people all their lives. A horning by another beast was ruled out, as all had been dehorned.

Until I read this article I had dismissed the occurrence. Under the circumstances I thought I would share it with you. Unfortunately it is now way after the fact, but we have witnesses. Linda Moulton Howe may like to know out of interest's sake if nothing else. I am an ex-butcher and I have never seen a wound like this.

Yours faithfully,

Des Y., Wondai, Qld, Australia.

Toxic Waste Fertiliser

Dear Duncan: Being an organic gardener and growing my own 'clean' food, I was horrified by your item in Global News headed "US Farmers Using Toxic Waste as Fertiliser!" [NEXUS 4/06].

Imagine my dismay when a few days later I purchased a bag of gypsum (to incorporate into a patch of clay soil in my garden), only to read the formula on the label stitched into the top of the bag: "Sulphur, as Sulphates, 14.5% w/w; Calcium, as Gypsum, 18.5% w/w". This adds up to 33%. What constitutes the remaining 66%? I read on: "Cadmium, 15 mg/kg (maxi-

mum), Lead, 50 mg/kg (max.); Mercury, 5 mg/kg (max.)".

I enquired of the company who packaged the product where they obtained the gypsum and was referred to a company near Brisbane who supplied the bulk.

I phoned the company and, after questioning with some persistence, was informed that this gypsum is imported from, "Oh, all over the place, USA, north Africa, etc.", and that it is a by-product from the manufacture of phosphoric acid at the place of origin. Farmers use this product by the tonne to condition heavy soils. I wonder how many actually read the label.

Also, I was informed that in the near future the company would be cutting down on importing the gypsum and would be using a product from Mt Isa. Will this also be a by-product of the mining/chemical industry?

The label reads, "Organic Fertilizers". Ha!

Peggy B., Mullumbimby, NSW, Australia.

Urine: God's Healing Gift!

Dear Duncan: Just short note to tell you that after my cystoscopy (an investigation into the bladder) my urologist gladly informed me that there is no sign of interstitial cystitis. Praise the Lord! (This was on 2 December 1997.)

I have been imbibing my own urine now for six months: half a glass each morning. What a medical breakthrough!

I would like to join hands with everyone to march across Australia and demand that urine therapy be recognised as a superior treatment for all diseases. I want to shout it from the rooftops and get the churches to shout it from the pulpits. God's treatment! Is this His plan for us, nearing the year 2000, to reveal to us this wonderful, amazing secret that has been hidden from us?

The drug companies know the value of urine therapy and they do not want us to find out! They'd go broke!!!

I have worked for a Roman Catholic priest for over 15 years—dear Father Cyril Hatton who last week celebrated his golden jubilee, 50 years, in Sydney. I am his housekeeper

and I feel God has rewarded me with the knowledge of urine therapy and your brilliant NEXUS magazine to which I will always subscribe. NEXUS is also my "Bible".

I have started on colloidal silver, too, and feel this is a mighty powerful medicine, but urine therapy is free, free, free, costs me nothing and I am on top of the world. My chronic fatigue is gone, also my dreadful allergies.

Thank you again, dear Duncan. I am forever grateful to you and your NEXUS magazine, and I was delighted to see my letter published in Aug-Sept '97 issue. I hope other readers will look at urine therapy with an open mind and, if ill, imbibe a glass each day.

Yours forever gratefully,

Fiona M., Bilambil, NSW, Australia.

Medication Madness

Dear Editor: Our daughter was born in May 1995. She needed oxygen and had to be ventilated. Finally, we took her home in mid-July and she seemed to be well. Then, in January, she developed an infection which meant she had to go back into hospital and go on oxygen again.

There was nothing on the ward anyone could use to wash their hands to prevent further spread of infection. I went out and bought some, but too late. My daughter (then a year old) contracted haemophilus influenza A along with another extremely dangerous hospital-spread infection.

Then, the bombshell: a consultant told us she had congenital alveolar proteinosis and had maybe six months to live, "but we'll give her some treatment and see how we get on".

The treatment was appalling and, as we discovered later, unnecessary. At all of 14 months, she was put on daily doses of dexamethasone, azathioprine, budesonide, domperidone, ranitidine, cisapride and nystatin, and co-trimoxazole three times a week. Later, chloroquine and gaviscon were added. (She had already had eight different types of antibiotics along with loads of other "just in case" drugs.)

She screamed day and night, became huge overnight and ate

constantly. I looked at her one morning and realised if I did not do something she would not make it.

I started doing my own research. I discovered the original diagnosis was wrong: tests showed she had two elements missing in her essential fatty acid production and was lactose-intolerant.

One by one we found an alternative to the drugs. We now use aromatherapy oils to fight the inflammation in her lungs (no more nebulisers or steroids); aciprophilus (to replace the gut flora destroyed by all the antibiotics); co-enzyme Q10; herbs to detoxify and repair damage done by infections; lactose-free milk; and supplements to replace her missing essential fatty acids.

She is now doing very well and really getting better daily. I challenge the doctors who treated her to come up with just one patient who got well on cocktails of drugs such as those they administered to our daughter.

M.S., Banstead, Surrey, UK, as published in *What Doctors Don't Tell You*, October 1997.

Induced Remission Therapy

Dear Duncan: I buy NEXUS regularly for the informative articles and comments from your readers. NEXUS stands out in the crowd. No repression, and you tell it like it is.

I particularly found Dr Sam Chachoua's article on Induced Remission Therapy enlightening [NEXUS 5/01]. At last it would appear he has found a medium that will let him have his say.

I did not find anything he had to say about cancer and its cures a surprise. Considering the time we humans have been on this planet and the amount of information we should have gathered and put to use to cure some of the longstanding diseases in our society, we should have found a cure for cancer by now.

Dr Chachoua has, it seems, done just that, and yet no one who matters wants to know about it! Amazing! Keep up the good work, NEXUS!

Bob G., robertog@alphalink.com.au, Glen Waverley, Vic., Australia.
